

# PLEASE HELP US TO IMPROVE FUTURE RESEARCH IN WOMEN'S HEALTH

Clinical studies aim to improve the way we treat patients. The results of research are reported as 'outcomes'. A commonly used outcome for health care treatments is 'satisfaction' or 'frequency of side effects' but there are many different outcomes which can be reported.

Our project wants to find out which are the most important outcomes for women undergoing induction of labour (labour that is started artificially) so that we can recommend what clinical studies should report in the future. The outcomes should be important to everybody involved in the induction of labour process.

**Would you like to use your experiences to help us to improve medical research in the future?**

If you, your partner or relative has undergone induction of labour, we would like to invite you to take part in a workshop discussion on which outcomes you think are most important.

If you would like to take part or if you would like more information, please contact us:
